An own daughter of the rare and valuable Silveiras Style, who has sired more Champions across multiple breeds than any bull in history. And to make 5041 even more valuable, she is backed on her maternal side by two of the breed's great maternal sires, SAV Bismarck and New Design 878. Her mating to the popular Select Sires sire SAV Supercharger will provide a quick return on your investment. Don't miss this opportunity! Safe in calf to SAV SUPERCHARGER 6813 due 5/11/21.

GREENE COUNTY ANGUS ASSOCIATION SALE PROCEDURES & GUIDELINES

Last revised February 2018

1. Consignors must provide the sale committee with the AAA registration number for each animal (including an AHIR report for bulls over 8 months). Any notes to be included in the catalog should be provided in written form to the sale committee.
2. All pedigrees (including reference sires) or pictures included in the catalog are charged as a lot and carry fixed sales expenses.
3. All cattle are accepted at the discretion of the sale committee.
4. All cattle *must* be clipped and groomed approximately 30 days before sale date.
5. **All GCAA members, especially consignors, are expected to come to work sessions before the sale, help on the day of the sale and come to the work session the day after the sale.**
6. Cattle *must* be delivered to the sale site by noon of the day of the sale. Animals *must* have a numbered ear tag (white tag w/black numbers on both sides) corresponding to their lot number from the sale catalog. The consignor should provide one bale of good hay per animal.
7. Consignors are responsible for the registration and transfer of cattle to the new owner within 30 days after the sale.
8. **Any animal consigned for a GCAA sale with a potential AM, NH or CA carrier in their ancestry must be certified AM, NH or CA free.**
9. All cattle are expected to be sound, in good health, and meet the following requirements.
 - a. Cows must be less than 11 years old *on* date of sale.
 - b. Cows 2 years old or older must be bred or have calves at side.
 - c. All animals over 6 months old must have a certificate of veterinary inspection. This inspection must be conducted within 30 days of the sale.
 - d. Pregnancy status *must* be noted on the certificate of veterinary inspection.
 - e. All animals must have clear eyes, no white spots.
 - f. All animals must have EID tags.
10. Virgin bulls up to 24 months old may be consigned.
 - a. They must be entered in the Angus association AHIR program and have EPD's on their registration.
 - b. If over 365 days of age they must have a breeding soundness exam included with their health papers.
 - c. Bulls over 8 months old will not be sold at side of the dam and will be cataloged separately.
 - d. Bulls over 8 months old must have been genomically tested.
 - e. Bulls over 8 months old must have an adjusted weaning weight of 550 lb. or more at 205 days of age adjusted yearling weight of 950 lb. or more at 365 days of age. Adjusted weaning & yearly weights should be included with the health papers.

Driving the science of better breeding

There's little room for error in the cattle business. Producers need the most advanced information to make smart selection decisions, and Angus Genetics Inc. (AGI) provides it through genomic-enhanced expected progeny differences (GE-EPDs).

EPDs that traditionally contained all pedigree, performance and progeny information now also include results from available genomic, or DNA, tests. Breeders who use genomic technology give buyers access to AGI-generated GE-EPDs that provide:

- Increased predictability and decreased risk for young and unproven animals due to enhanced accuracy of EPDs
- Better characterization of genetics for difficult-to-measure performance traits (such as carcass traits, maternal traits and feed efficiency)
- The ability to make more rapid progress for traits that are important to you, due to:
 - more accurate selection
 - easier identification of genetic outliers
 - the ability to propagate young animals with confidence earlier in their lives

In fact, GE-EPDs on unproven animals have the same amount of accuracy as if they had recorded 8-33 calves, depending on the trait. That's valuable insight, offered regularly through the breed's weekly national cattle evaluation at www.angus.org.

How do you know if EPDs are genomic-enhanced?

Ask your breeder, refer to the registration paper, or look for the AGI GE-EPD logo, Angus GS™ powered by partner Neogen GeneSeek or the HD50k or i50k by partner Zoetis.

Dollar value indexes, or **\$Values**, are a tool used to select for several traits at once based on a specific breeding objective. An economic index approach takes into account genetic and economic values as well as the relationships between traits to select for profit.

American Angus Association \$Value Indexes

Maternal Weaned Calf Value (\$M), an index expressed in dollars per head, predicts profitability differences in progeny due to genetics from conception to weaning. \$M is built off of a self-replacing herd model where commercial cattlemen replace 25% of their breeding females in the first generation and 20% in subsequent generations. Remaining cull females and all male progeny are sold as feeder calves. Increased selection pressure on \$M aims to decrease overall mature cow size and improve foot structure and fertility while maintaining weaning weights consistent with today's production.

Weaned Calf Value (\$W), an index expressed in dollars per head, provides the expected difference in future progeny preweaning performance from birth to weaning. \$W assumes that producers retain 20% of their female progeny for replacements and sell the rest of their cull female and male progeny as feeder calves. Over time, increased selection pressure on \$W will increase pre-weaning growth through additional weaning weight and maternal milk with expenses adjustment for mature size and maternal milk.

Feedlot Value (\$F), an index expressed in dollars per head, is the expected average difference in future progeny performance for postweaning merit compared to progeny of other sires. The underlying objective assumes commercial producers will retain ownership of cattle through the feedlot phase and sell fed cattle on a carcass weight basis with no considerations of premiums or discounts for quality and yield grade.

Grid Value (\$G), an index expressed in dollars per carcass, is the expected average difference in future progeny performance for carcass grid merit, including quality and yield grade attributes, compared to progeny of other sires.

Beef Value (\$B), an index expressed in dollars per carcass, facilitates simultaneous multi-trait genetic selection for feedlot and carcass merit. \$B represents the expected average differences in the progeny post-weaning performance and carcass value compared to progeny of other sires. This index assumes commercial producers wean all male and female progeny, retain ownership of these animals through the feedlot phase and market these animals on a quality-based carcass grid.

Combined Value (\$C), an index expressed in dollars per head, includes all traits that make up both \$M and \$B with the objective that commercial producers will replace 20% of their breeding females per year with replacement heifers retained within their own herd. The remaining cull heifer and steer progeny are then assumed to be sent to the feedlot where the producers retain ownership of those cattle and eventually sell them on a quality-based carcass merit grid.
