A low birth weight cow with excellent marbling. Plenty of milk from the popular Pride cow family. She is bred for an early Spring calf to GVF Niagara 9097 (BW 0.3, WW 69, YW 129, MM 25). Excellent moderate framed cow here.

American Angus Association Selection Tools FOOT SCORE

Expected Progeny Difference (EPD), is the prediction of how future progeny of each animal are expected to perform relative to the progeny of other animals listed in the database. EPDs are expressed in units of measure for the trait, plus or minus. Interim EPDs may appear on young animals when their performance has yet to be incorporated into the American Angus Association National Cattle Evaluation (NCE) procedures. This EPD will be preceded by an "I", and may or may not include the animal's own performance record for a particular trait, depending on its availability, appropriate contemporary grouping, or data edits needed for NCE.

Accuracy (ACC), is the reliability that can be placed on the EPD. An accuracy of close to 1.0 indicates higher reliability. Accuracy is impacted by the number of progeny and ancestral records included in the analysis.

Calving Ease Direct (CED), is expressed as a difference in percentage of unassisted births, with a higher value indicating greater calving ease in first-calf heifers. It predicts the average difference in ease with which a sire's calves will be born when he is bred to first-calf heifers.

Birth Weight (BW), expressed in pounds, is a predictor of a sire's ability to transmit birth weight to his progeny compared to that of other sires.

Weaning Weight (WW), expressed in pounds, is a predictor of a sire's ability to transmit weaning growth to his progeny compared to that of other sires.

Residual Average Daily Gain (RADG), feed efficiency expressed in pounds per day, is a predictor of a sire's genetic ability for postweaning gain in future progeny compared to that of other sires, given a constant amount of feed consumed.

Yearling Weight (YW), expressed in pounds, is a predictor of a sire's ability to transmit yearling growth to his progeny compared to that of other sires.

Yearling Height (YH), is a predictor of a sire's ability to transmit yearling height, expressed in inches, compared to the that of other sires.

Scrotal Circumference (SC), expressed in centimeters, is a predictor of the difference in transmitting ability for scrotal size compared to that of other sires.

Docity (DOC), is expressed as a difference in yearling cattle temperament, with a higher value indicating more favorable docility in a sire's offspring compared to another sire.

MATERNAL Heifer Pregnancy (HP), is a selection tool to increase the probability or chance of a sire's daughters becoming pregnant as first-calf heifers during a normal breeding season. A higher EPD is the more favorable direction, and the EPD is reported in percentage units.

Calving Ease Maternal (CEM), is expressed as a difference in percentage of unassisted births, with a higher value indicating greater calving ease in first-calf daughters. It predicts the average ease with which a sire's daughters will calve as first-calf heifers when compared to daughters of other sires.

Maternal Milk (Milk), is a predictor of a sire's genetic merit for milk and mothering ability in his daughters compared to daughters of other sires. In other words, it is that part of a calf's weaning weight attributed to milk and mothering ability.

Mature Weight (MW), expressed in pounds, is a predictor of the difference in mature weight of daughters of a sire compared to the daughters of other sires.

Mature Height (MH), expressed in inches, is a predictor of the difference in mature height of a sire's daughters compared to daughters of other sires.

Claw Set (Claw), is expressed in units of claw-set score. A lower EPD is more favorable, indicating a sire will produce progeny with more ideal claw set, which is toes that are symmetrical, even and appropriately spaced.

Foot Angle (Angle), is expressed in units of foot-angle score. A lower EPD is more favorable, indicating a sire will produce progeny with more ideal foot angle, which is a 45-degree angle at the pastern joint with appropriate toe length and heel depth.

CARCASS
The genetic evaluation produces a single set of EPDs for carcass traits where the units of measure are in trait format and analyzed on an age-constant basis.

Carcass Weight (CW), expressed in pounds, is a predictor of the differences in hot carcass weight of a sire's progeny compared to progeny of other sires.

Marbling (Marb), is expressed as a fraction of the difference in USDA marbling score of a sire's progeny compared to progeny of other sires.

Ribeye Area (RE), expressed in square inches, is a predictor of the difference in ribeye area of a sire's progeny compared to progeny of other sires.

Fat Thickness (Fat), expressed in inches, is a predictor of the differences in external fat thickness at the 12th rib (as measured between the 12th and 13th ribs) of a sire's progeny compared to progeny of other sires.

\$VALUE INDEXES
\$Value Indexes, reported in dollars per head, are multi-trait selection indexes where a higher value suggests more profit. The \$Value is an estimate of how future progeny of each sire are expected to perform, on average, compared to progeny of other sires if sires were randomly mated to cows and if calves were exposed to the same environment.

Maternal Weaned Calf Value (\$M), expressed in dollars per head, predicts profitability differences in progeny due to genetics from conception to weaning. Increased selection pressure on \$M aims to decrease overall mature cow size and improve foot structure and fertility while maintaining weaning weights consistent with today's production.

Weaned Calf Value (\$W), expressed in dollars per head, provides the expected difference in future progeny preweaning performance from birth to weaning. Increased selection pressure on \$W increases weaning and maternal milk traits while increasing mature cow size.

Cow Energy Value (\$EN), expressed in dollars savings per cow per year, assesses differences in cow energy requirements as an expected dollar savings difference in daughters of sires. A larger value is more favorable when comparing two animals. Components for computing \$EN savings difference include lactation energy requirements and energy costs associated with differences in mature cow size.

Feedlot Value (\$F), expressed in dollars per head, is the expected average difference in future progeny performance for postweaning merit compared to progeny of other sires. The underlying objective assumes commercial producers will retain ownership of cattle through the feedlot phase and sell fed cattle on a carcass weight basis with no considerations of premiums or discounts for quality and yield grade.

Grid Value (\$G), expressed in dollars per carcass, is the expected average difference in future progeny performance for carcass grid merit, including quality and yield grade attributes, compared to progeny of other sires.

Beef Value (\$B), expressed in dollars per carcass, represents the expected average differences in the progeny postweaning performance and carcass value compared to progeny of other sires. This index assumes commercial producers wean all male and female progeny, retain ownership of these animals through the feedlot phase, and market these animals on a quality-based carcass grid.

**Greene County
Angus Association
Inaugural
Bull Sale**

Friday, March 4th 2022

7:00 P.M.

Greene County Fairgrounds • Greeneville, TN

56 IMF Rito 9020

BULL Owner: Dan Isenberg - Iron Mountain Farms Tattoo: 9020
Calved: 9/2/20 AAA# *20030525

+1	+4.1	+62	+116	+13	+0.6	+1.18	+39	+0.12	+0.35

The sire of this yearly bull is IMF Rito 3264 who is himself a direct son of the renowned RR Rito 707. This bull dominated the 1968 PIC Bull Test in Stamford, MI, where he was the top yearling weight bull & the top gaining bull with a ratio of 129. Two-thirds interest sold to ABS in Wisconsin & Pioneer Beef Cattle in Iowa. RR Rito 707 is truly one of the landmark sires of the breed. He sired three landmark sires: Rito 707 of Ideal 533-70 (Rito 149), Rito 707 of Ideal 836 71 (72) & PBC 707 1M F0203 (Rito F0203). Each of these bulls contributed immensely to the breed, adding muscle & performance. Rito 9020, like his sire & those before him, will certainly carry on the tradition of his ancestors. These genetics are difficult if not impossible to come by.

57 IMF Black Magic 9060

BULL Owner: Dan Isenberg - Iron Mountain Farms Tattoo: 9060
Calved: 9/6/20 AAA# 20035347

A Chimney Top Traction CD4 son with low BW, WW in top 30% and YW in top 20%.

DIRECTOR OF HERD IMPROVEMENT.

With more Angus influenced cattle qualifying for the *Certified Angus Beef*® brand than ever before, it's clear that the Angus bull has become America's bull. He sires calving ease, growth and superior marbling. He works well in any environment, and on any cow, regardless of breed. Make sure that America's bull serves as your director of herd improvement.

Angus. America's breed. Go to www.Angus.org/businessbreed or call 816.383.5100 to learn more.

GREENE COUNTY ANGUS ASSOCIATION SALE PROCEDURES & GUIDELINES

Last revised February 2018

1. Consignors must provide the sale committee with the AAA registration number for each animal (including an AHIR report for bulls over 8 months). Any notes to be included in the catalog should be provided in written form to the sale committee.
2. All pedigrees (including reference sires) or pictures included in the catalog are charged as a lot and carry fixed sales expenses.
3. All cattle are accepted at the discretion of the sale committee.
4. All cattle *must* be clipped and groomed approximately 30 days before sale date.
5. **All GCAA members, especially consignors, are expected to come to work sessions before the sale, help on the day of the sale and come to the work session the day after the sale.**
6. Cattle *must* be delivered to the sale site by noon of the day of the sale. Animals *must* have a numbered ear tag (white tag w/black numbers on both sides) corresponding to their lot number from the sale catalog. The consignor should provide one bale of good hay per animal.
7. Consignors are responsible for the registration and transfer of cattle to the new owner within 30 days after the sale.
8. **Any animal consigned for a GCAA sale with a potential AM, NH or CA carrier in their ancestry must be certified AM, NH or CA free.**
9. All cattle are expected to be sound, in good health, and meet the following requirements.
 - a. Cows must be less than 11 years old *on* date of sale.
 - b. Cows 2 years old or older must be bred or have calves at side.
 - c. All animals over 6 months old must have a certificate of veterinary inspection. This inspection must be conducted within 30 days of the sale.
 - d. Pregnancy status *must* be noted on the certificate of veterinary inspection.
 - e. All animals must have clear eyes, no white spots.
 - f. All animals must have EID tags.
10. Virgin bulls up to 24 months old may be consigned.
 - a. They must be entered in the Angus association AHIR program and have EPD's on their registration.
 - b. If over 365 days of age they must have a breeding soundness exam included with their health papers.
 - c. Bulls over 8 months old will not be sold at side of the dam and will be cataloged separately.
 - d. Bulls over 8 months old must have been genomically tested.
 - e. Bulls over 8 months old must have an adjusted weaning weight of 550 lb. or more at 205 days of age adjusted yearling weight of 950 lb. or more at 365 days of age. Adjusted weaning & yearly weights should be included with the health papers.

Driving the science of better breeding

There's little room for error in the cattle business. Producers need the most advanced information to make smart selection decisions, and Angus Genetics Inc. (AGI) provides it through genomic-enhanced expected progeny differences (GE-EPDs).

EPDs that traditionally contained all pedigree, performance and progeny information now also include results from available genomic, or DNA, tests. Breeders who use genomic technology give buyers access to AGI-generated GE-EPDs that provide:

- Increased predictability and decreased risk for young and unproven animals due to enhanced accuracy of EPDs
- Better characterization of genetics for difficult-to-measure performance traits (such as carcass traits, maternal traits and feed efficiency)
- The ability to make more rapid progress for traits that are important to you, due to:
 - more accurate selection
 - easier identification of genetic outliers
 - the ability to propagate young animals with confidence earlier in their lives

In fact, GE-EPDs on unproven animals have the same amount of accuracy as if they had recorded 8-33 calves, depending on the trait. That's valuable insight, offered regularly through the breed's weekly national cattle evaluation at www.angus.org.

How do you know if EPDs are genomic-enhanced?

Ask your breeder, refer to the registration paper, or look for the AGI GE-EPD logo, Angus GS™ powered by partner Neogen GeneSeek or the HD50k or i50k by partner Zoetis.

Dollar value indexes, or **\$Values**, are a tool used to select for several traits at once based on a specific breeding objective. An economic index approach takes into account genetic and economic values as well as the relationships between traits to select for profit.

American Angus Association \$Value Indexes

Maternal Weaned Calf Value (\$M), an index expressed in dollars per head, predicts profitability differences in progeny due to genetics from conception to weaning. \$M is built off of a self-replacing herd model where commercial cattlemen replace 25% of their breeding females in the first generation and 20% in subsequent generations. Remaining cull females and all male progeny are sold as feeder calves. Increased selection pressure on \$M aims to decrease overall mature cow size and improve foot structure and fertility while maintaining weaning weights consistent with today's production.

Weaned Calf Value (\$W), an index expressed in dollars per head, provides the expected difference in future progeny preweaning performance from birth to weaning. \$W assumes that producers retain 20% of their female progeny for replacements and sell the rest of their cull female and male progeny as feeder calves. Over time, increased selection pressure on \$W will increase pre-weaning growth through additional weaning weight and maternal milk with expenses adjustment for mature size and maternal milk.

Feedlot Value (\$F), an index expressed in dollars per head, is the expected average difference in future progeny performance for postweaning merit compared to progeny of other sires. The underlying objective assumes commercial producers will retain ownership of cattle through the feedlot phase and sell fed cattle on a carcass weight basis with no considerations of premiums or discounts for quality and yield grade.

Grid Value (\$G), an index expressed in dollars per carcass, is the expected average difference in future progeny performance for carcass grid merit, including quality and yield grade attributes, compared to progeny of other sires.

Beef Value (\$B), an index expressed in dollars per carcass, facilitates simultaneous multi-trait genetic selection for feedlot and carcass merit. \$B represents the expected average differences in the progeny post-weaning performance and carcass value compared to progeny of other sires. This index assumes commercial producers wean all male and female progeny, retain ownership of these animals through the feedlot phase and market these animals on a quality-based carcass grid.

Combined Value (\$C), an index expressed in dollars per head, includes all traits that make up both \$M and \$B with the objective that commercial producers will replace 20% of their breeding females per year with replacement heifers retained within their own herd. The remaining cull heifer and steer progeny are then assumed to be sent to the feedlot where the producers retain ownership of those cattle and eventually sell them on a quality-based carcass merit grid.
